On-Device Transcription

The scanner delivers a picture of a page, and a picture cites nothing. The recognition engine reads it on this machine, and the reading crosses the same doors that typed text crosses: the strip, the screen, the dedupe, and the fence. Nothing about the path is privileged by its medium.

Every recognized page carries its own provenance. The engine stamps the request type and the build of the operating system it ran under, the page carries the lowest confidence among its candidates, and a weak region marks the whole page rather than hiding inside it.

A page the engine refuses is a named refusal, never an invented blank. The record shows the hole and the reason for the hole, because a transcript that hides its gaps is a transcript that manufactures confidence it did not earn.
