Formula Class: Notation Integrity

$E = mc^2$

$f(x) = a x^2 + b x + c$

$x_1 + x_2 = 7$

The exponent two above is a separate run at a raised baseline and a smaller size; the subscripts one and two sit below theirs. A text-layer extractor reads content order and glues every run inline (E = mc2 - the cue loss this corpus measures). A layout-aware converter may keep the visual cue, flatten it, or displace it: the fidelity table records which, per tier, from the same bytes.
